

ABSTRACT OF THE DISCLOSURE

Through the use of an intermediate party, a first party is given the ability to communicate with a second party, with the communication appearing as if it originated with the intermediate party. Specifically, in a protected network system, the protected network is capable of acting as a conduit through which an entity, such as law enforcement, can communicate with an entity attempting an unauthorized access attempt unbeknownst to the entity attempting the unauthorized access attempt. This allows, for example, the detection and identification of the entity attempting the unauthorized access attempt.
